Executive Summary — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Apple **Automated Device Enrollment (ADE)** turns every company-owned Mac into a zero-touch, supervised, fully managed device the moment it is powered on — no imaging, no manual MDM steps, no local-admin hand-holding. This solution manages those Macs with **Jamf Pro**, the dedicated macOS management platform, and connects them to **Microsoft Entra ID** so sign-in is enforced with corporate identity and Conditional Access.

Most organizations that already run Jamf for their Mac fleet still need their Macs to be **first-class citizens in Microsoft Entra**: registered, compliant, and gated by the same Conditional Access policies as their Windows estate. This solution delivers exactly that, as a single, repeatable deployment a Mac admin can follow end to end:

- **Zero-touch provisioning with Jamf.** Macs in **Apple Business Manager** are assigned to a Jamf

Pro **Automated Device Enrollment** instance and a **PreStage Enrollment**, so they enroll supervised, branded, and pre-loaded the first time they run Setup Assistant.

- **Platform SSO with the Microsoft Enterprise SSO plug-in.** Jamf deploys the Single Sign-On

Extension configuration profile. Users sign in to macOS and to Microsoft 365 with their **Entra ID** identity, backed by a hardware-bound **Secure Enclave** key — phishing-resistant, not a synced password.

- **Compliance flows Jamf → Intune.** The **Jamf Pro ↔ Intune Device Compliance** integration

registers each Mac in Entra and reports its Jamf compliance state to Intune, so Macs appear in **Intune → Devices** as partner-managed and compliant.

- **SSO enforced by Conditional Access.** Entra **Conditional Access** requires a compliant,

registered Mac (and, optionally, a phishing-resistant authentication strength) before granting access to Microsoft 365 — turning Platform SSO from "available" into **mandatory**.

The package follows the standard Phoenixtekk shape — **Assess → Configure → Pilot → Validate → Expand** — with exact, click-by-click steps across both consoles, a requirements guide that tells you how to verify *and* fix each prerequisite, five ready-to-run PowerShell scripts (Microsoft Graph and the Jamf Pro API), and testing/troubleshooting guides with clear pass/fail gates.

Outcome: company Macs that Jamf provisions and manages, that authenticate with corporate identity via a phishing-resistant Secure Enclave key, and that Entra Conditional Access treats as compliant, registered, SSO-enforced devices — delivered by your own team, in a controlled pilot, without a consulting engagement.

1. Solution Overview — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

What this solution is

This solution stands up company-owned Macs that **Jamf Pro manages** and **Microsoft Entra enforces**. It combines three capabilities into one repeatable deployment:

1. **Automated Device Enrollment (ADE)** — Apple's zero-touch enrollment program (formerly DEP).

Company-owned Macs that belong to your **Apple Business Manager (ABM)** organization are assigned to **Jamf Pro** as their MDM and enroll automatically — **supervised** — the first time they run Setup Assistant. Management is mandatory and locked to the device.

1. **Platform Single Sign-On (Platform SSO)** — Apple's macOS framework that lets a third-party

identity provider extend sign-in to the Mac itself. **Jamf deploys** the **Microsoft Enterprise SSO** extension via a configuration profile, so the Mac registers with **Microsoft Entra ID** and users authenticate with their corporate identity at the login window and across apps and Safari/Edge/Chrome.

1. **Jamf Pro ↔ Microsoft Intune Device Compliance** — the supported integration that registers each

Jamf-managed Mac in **Entra ID** and reports its **compliance** state to **Intune**. Combined with Entra **Conditional Access**, this is what makes SSO **enforced**: only a compliant, registered Mac is allowed into Microsoft 365.

Together they give you a Mac that Jamf provisions and manages, that signs in with corporate identity, and that Conditional Access treats as a trusted, compliant device.

Why Jamf as the MDM (and Intune for identity & compliance)

A macOS device can have **only one MDM authority**. Organizations that have standardized on **Jamf Pro** for deep, Mac-native management (PreStage, policies, patch, Self Service) keep Jamf as the MDM — you do **not** move those Macs into Intune. Instead, you connect Jamf to the Microsoft cloud so the Macs become **Entra-registered and Intune-compliant**, and you enforce access with the **same Conditional Access** policies that protect the rest of your estate. Intune is the **identity and compliance authority**; Jamf is the **device management authority**. This is the only architecture in which "Jamf Pro device management" and "SSO enforced via Intune/Entra" coexist correctly.

How it works

1. **ABM → Jamf Pro.** You connect ABM to Jamf Pro with an **Automated Device Enrollment** instance

(an ADE/MDM-server token). Macs assigned to the Jamf MDM server in ABM enroll into Jamf.

1. **PreStage Enrollment.** A **PreStage Enrollment** in Jamf defines the out-of-box experience:

supervised mode, account creation, which Setup Assistant panes to skip, and which apps/profiles pre-load.

1. **Power on → enroll.** When a user (or technician) powers on the Mac and connects to a network,

Setup Assistant contacts Apple, discovers the Jamf MDM server, and enrolls automatically. The device becomes supervised and managed by Jamf; your apps and profiles flow down.

1. **Platform SSO registration.** Jamf deploys a **Single Sign-On Extension** configuration profile

(Microsoft Enterprise SSO) and the **Company Portal** app. On first sign-in, Company Portal completes Platform SSO **registration**: the Mac generates a hardware-bound key in the **Secure Enclave** and registers with Entra ID.

1. **Compliance to Intune.** Through the **Jamf Pro ↔ Intune Device Compliance** connector, Jamf

sends the Mac's inventory and compliance state to Intune; the Mac appears in **Intune** → **Devices** as a partner-managed, compliant device.

1. **SSO enforced.** Entra **Conditional Access** requires a **compliant** (and optionally phishing-resistant) Mac before granting Microsoft 365 access. Platform SSO supplies the credential; Conditional Access makes it mandatory.

Platform SSO authentication methods (choose one)

- **Secure Enclave key (recommended)** — a hardware-bound key in the Mac's Secure Enclave signs authentication. Phishing-resistant; the local password is decoupled from Entra. Best security.
- **Password sync** — the user's local macOS password is kept in sync with their Entra password. Simplest for users; least hardened.
- **Smart card** — authentication via a smart card/certificate. For high-assurance environments.

This solution standardizes on the **Secure Enclave key** method, with notes for the alternatives.

Benefits

- **Zero-touch deployment** — Macs enroll supervised into Jamf on first boot; no imaging, no manual MDM steps.
- **Keep your Jamf investment** — full Mac-native management (PreStage, policies, patch, Self Service) stays in Jamf.
- **Corporate identity on the Mac** — Entra sign-in at the login window and across apps/browsers.
- **Phishing-resistant** — Secure Enclave key, hardware-bound, never leaves the device.
- **Compliance in Intune** — Macs appear as partner-managed, compliant devices alongside Windows.
- **SSO enforced** — Conditional Access blocks non-compliant or non-registered Macs from Microsoft 365.

Limitations (be honest with buyers)

- A Mac has **one MDM**. In this design **Jamf is the MDM**; the Macs are **not** Intune-MDM-managed. Conditional Access works via the **partner compliance** integration, not Intune-native MDM.
- ADE requires devices to be in **Apple Business Manager** (purchased via Apple/an authorized reseller, or added with **Apple Configurator** — the latter adds a provisional 30-day release period).
- Platform SSO requires **macOS 13 Ventura or later** (macOS 14 Sonoma+ strongly recommended).
- Requires Jamf's **APNs (MDM Push) certificate** and the **ADE/ABM token**, both renewed annually — hard expiry dates that block enrollment if missed.
- Platform SSO registration and compliance reporting depend on the **Company Portal** app and the **Microsoft Enterprise SSO** extension being present and current.

- Microsoft and Jamf have **evolved** the integration over time (the legacy "Conditional Access" connector was superseded by **Device Compliance**). Always confirm the **current** integration name and steps in the Jamf and Microsoft documentation before connecting.
- Personally-owned (BYO) Macs use a different (user-enrollment) path and are out of scope here.

The standard Phoenixtekk deployment model

This solution uses **one** model so the process is repeatable across our catalog:

> ***Company-owned, Apple Business Manager–sourced Macs, automatically enrolled into Jamf Pro (supervised), registered with Microsoft Entra ID and reporting compliance to Intune via the Jamf ↔ Intune Device Compliance integration, with Platform SSO via the Microsoft Enterprise SSO extension and a Secure Enclave key, and SSO enforced by Entra Conditional Access.***

Every step follows the Phoenixtekk pattern: **Assess** → **Configure** → **Pilot** → **Validate** → **Expand.**

2. Requirements — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Confirm **every** requirement below before you begin. Each entry follows the same pattern: **Description · Why required · How to verify · How to implement if missing.** Category-wide prerequisites (Entra tenant, Intune licensing, admin roles, pilot group, network) are covered once in the **Global Requirements — Intune Solutions** document; the items here are specific to Jamf-managed Apple ADE, Platform SSO, and the Jamf ↔ Intune Device Compliance integration.

R1. Apple Business Manager (or Apple School Manager) account

Description: A verified Apple Business Manager (ABM) organization. **Why:** ADE only works for devices that belong to your ABM organization; ABM is also where you assign devices to the **Jamf Pro** MDM server and accept device-management terms. **Verify:** Sign in to `https://business.apple.com` with an ABM Administrator account; the organization status is **active**. **Implement:** Enroll at `https://business.apple.com/enroll` using your **D-U-N-S** number; complete Apple's verification. Allow 1–5 business days.

R2. Jamf Pro tenant with administrative access

Description: A licensed **Jamf Pro** instance (cloud or on-prem) and an admin account with rights to manage enrollment, configuration profiles, and integrations. **Why:** Jamf Pro is the **MDM authority** in this design — it enrolls, supervises, and manages the Macs and deploys the SSO profile and Company Portal. **Verify:** Sign in to your Jamf Pro console (e.g. `https://yourorg.jamfcloud.com`) as an administrator; **Settings** is accessible. **Implement:** Provision Jamf Pro (Jamf Cloud is fastest) and assign an administrator role with **Settings**, **Enrollment**, and **Configuration Profiles** privileges.

R3. Jamf Pro Apple Push Notification service (APNs) certificate

Description: A valid MDM Push certificate connecting **Jamf Pro** to Apple's push service. **Why:** Every Apple device managed by Jamf requires APNs; without it, no Mac can enroll or receive commands. (This

certificate lives in **Jamf**, not Intune.) **Verify:** Jamf Pro → **Settings** → **Global** → **Push certificates** (or **Global Management** → **Push Certificates**) shows a valid Apple **MDM Push** certificate with a future expiration. **Implement:** In Jamf Pro, create a Push Certificate request, sign in to `https://identity.apple.com` with a **company Apple ID** (not personal), upload the signed certificate. **Renew annually with the same Apple ID** — a new Apple ID re-issues the cert and unenrolls all devices.

R4. Automated Device Enrollment instance in Jamf Pro (ABM ↔ Jamf token)

Description: An ABM **MDM server** that points to Jamf, with its server token (`.p7m`) uploaded into Jamf Pro as an **Automated Device Enrollment** instance. **Why:** This is the trust link that lets ABM-assigned devices enroll into your Jamf tenant. **Verify:** Jamf Pro → **Settings** → **Global** → **Automated Device Enrollment**; an instance is listed with a future token expiration. **Implement:** In Jamf Pro, download the **public key**; in ABM **Preferences** → **MDM Servers**, create an MDM server named clearly (e.g. **Jamf – Production**), upload the public key, download the server token; upload that token into Jamf's Automated Device Enrollment settings. **Renew annually.**

R5. Devices present in Apple Business Manager and assigned to Jamf

Description: The target Macs appear in ABM and are assigned to the **Jamf** MDM server. **Why:** Only ABM devices can use ADE, and assignment tells Apple which MDM a device should enroll into during Setup Assistant. **Verify:** ABM → **Devices** → select the device → **MDM Server** shows your **Jamf** server. **Implement:** Purchase through Apple or an **Apple-authorized reseller** linked to your ABM (devices appear automatically), or add existing Macs with **Apple Configurator** (note: Configurator-added devices get a **30-day provisional period**). Then ABM → **Devices** → **Edit MDM Server** → choose the **Jamf** server, and in Jamf **refresh** the ADE instance.

R6. Jamf PreStage Enrollment for macOS

Description: A macOS **PreStage Enrollment** in Jamf that defines the zero-touch experience. **Why:** The PreStage controls supervision, account creation, the Setup Assistant panes shown/hidden, and which configuration profiles and apps deploy at enrollment. **Verify:** Jamf Pro → **Computers** → **PreStage Enrollments**; a macOS PreStage exists and has devices scoped to it. **Implement:** Create a PreStage (Implementation Guide §Phase 2), enable **Supervision** and **Make MDM Profile Mandatory**, set account creation, and scope the target serial numbers.

R7. Supported macOS version

Description: macOS **13 Ventura or later** (macOS **14 Sonoma+ recommended**). **Why:** Platform SSO and the Secure Enclave authentication method require macOS 13+; later releases materially improve registration reliability. **Verify:** Apple menu → **About This Mac**, or Jamf → device **Inventory** → **Operating System**. **Implement:** Upgrade via **System Settings** → **General** → **Software Update**, or enforce a minimum OS with a Jamf **Smart Group** + policy and a matching Intune **compliance** rule.

R8. Company Portal app for macOS (deployed by Jamf)

Description: The Microsoft **Company Portal** application installed on the Mac by **Jamf**. **Why:** Company Portal performs the Platform SSO **registration** with Entra ID **and** the device registration that the Jamf ↔

Intune compliance integration depends on. **Verify:** Jamf Pro → **Computers** → **Configuration Profiles / Apps**; Company Portal is scoped to your pilot group and installs post-enrollment. **Implement:** Add the macOS Company Portal as a Jamf **package/app** (or via the App Installers / VPP) and scope it to the pilot Smart Group as **Required**.

R9. Microsoft Enterprise SSO extension profile (deployed by Jamf)

Description: The **Microsoft Enterprise SSO** plug-in delivered via a Jamf macOS **Single Sign-On Extensions** configuration profile (Platform SSO). **Why:** This Apple-approved redirect extension brokers Entra authentication for Platform SSO and app/browser single sign-on. **Verify:** Jamf Pro → **Computers** → **Configuration Profiles**; a profile with a **Single Sign-On Extensions** payload (Platform SSO) exists targeting your pilot group. **Implement:** Create it during deployment (Implementation Guide §Phase 3), or run the included `JAMFADE-Set-JamfSSOProfile.ps1` to upload it via the Jamf Pro Classic API.

R10. Jamf Pro ↔ Microsoft Intune Device Compliance integration

Description: The supported connector that registers Jamf-managed Macs in **Entra ID** and reports their **compliance** to **Intune**. **Why:** This is what makes the Macs appear as compliant in Intune and lets **Conditional Access** enforce SSO/compliance — without it, Jamf-managed Macs are invisible to Entra/Intune policy. **Verify:** Intune admin center → **Tenant administration** → **Connectors and tokens** → **Partner device management** (or **Partner compliance management**) shows **Jamf** as **Active**; in Jamf, **Settings** → **Global** → **Device Compliance** (macOS) is **connected**. **Implement:** In Intune, enable the **Partner device management / compliance** connection for Jamf; in Jamf, **Settings** → **Global** → **Device Compliance** → **macOS** → **Configure**, sign in with a Global Administrator to grant the cloud-connector app consent, and complete the connection. Confirm the exact current path in Jamf and Microsoft docs (the integration was renamed from the legacy "Conditional Access").

R11. Entra ID Conditional Access policy for macOS

Description: A Conditional Access policy that requires a **compliant** (and optionally phishing-resistant) Mac for Microsoft 365. **Why:** This converts Platform SSO from "available" to **enforced** — non-compliant or non-registered Macs are blocked. **Verify:** Entra → **Protection** → **Conditional Access**; a policy targets **macOS** and requires **Require device to be marked as compliant** (start in **report-only**). **Implement:** Create the policy in Implementation Guide §Phase 4; pilot in **report-only**, then enable.

R12. Network access to Apple, Jamf, and Microsoft endpoints

Description: Outbound HTTPS to Apple's enrollment/push/software endpoints, your Jamf Pro host, and Microsoft Entra/Intune endpoints. **Why:** Setup Assistant, ADE discovery, APNs, Jamf check-in, Entra registration, and compliance reporting all depend on these endpoints. **Verify:** From the device network, reach `https://mdmenrollment.apple.com`, `https://gdmf.apple.com`, the Apple push range `*.push.apple.com` (TCP 443 and 5223), your `*.jamfcloud.com` host, and `https://login.microsoftonline.com`. **Implement:** Allow Apple's published ranges (Apple support article HT210060), your Jamf Cloud host, and Microsoft's Entra/Intune ranges through proxy/firewall. Do **not** TLS-inspect Apple push/enrollment.

Global Requirements — Intune Solutions (category-level)

These requirements apply to **every** Phoenixtekk solution in the **Intune Solutions** category. They are published once at the category level on the marketplace so individual solution listings stay small. Confirm these are in place before deploying *any* Intune solution.

Each entry: **Description · Why required · How to verify · How to implement if missing.**

G1. Microsoft Entra ID tenant

Description: An active Microsoft Entra ID (Azure AD) tenant. **Why:** It is the identity backbone for every cloud and Intune-managed resource. **Verify:** Sign in to `https://entra.microsoft.com` as an administrator. **Implement:** Create a Microsoft 365/Azure subscription, which provisions a tenant.

G2. Microsoft Intune subscription

Description: An Intune-bearing license plan. **Why:** Intune delivers all configuration, compliance, enrollment, and security policies. **Verify:** `https://intune.microsoft.com` loads and **Tenant administration** → **Tenant status** shows an active subscription. **Implement:** Assign Microsoft 365 E3/E5, Business Premium, or standalone Intune Plan 1.

G3. Administrative roles

Description: Appropriate Entra/Intune admin roles for the operator. **Why:** Creating policies, enrollment connectors, and configuration profiles requires elevated rights. **Verify:** Entra → **Roles and administrators**; confirm **Intune Administrator** (or Global Administrator for connector setup). **Implement:** Assign **Intune Administrator** to the operator; reserve Global Administrator for tenant-wide changes.

G4. Device enrollment in Intune

Description: Targeted devices are enrolled and manageable in Intune. **Why:** Policies only reach enrolled devices, regardless of platform (Windows, macOS, iOS/iPadOS, Android). **Verify:** Intune → **Devices** → **All devices**; the device appears and is **compliant**. **Implement:** Configure the appropriate enrollment method for the platform (e.g. automatic enrollment for Windows, Automated Device Enrollment for Apple) and enroll the device.

G5. Pilot security group

Description: A Microsoft Entra security group for pilot/targeted users or devices. **Why:** Every Phoenixtekk solution is piloted to a small group before fleet rollout. **Verify:** Entra → **Groups**; the pilot group exists with intended members. **Implement:** Entra → **Groups** → **New group** → type **Security** → add pilot members.

G6. Supported, current operating system

Description: A supported OS baseline with current updates for the targeted platform. **Why:** Modern Intune features and security settings assume a patched, vendor-supported OS. **Verify:** Check the device's OS version (e.g. `winver` on Windows, **About This Mac** on macOS) or Intune → device → **Hardware**. **Implement:** Deploy update policies (Windows Update rings, macOS update/compliance policies) or upgrade to a supported release.

G7. Network access to required cloud endpoints

Description: Outbound HTTPS to Microsoft 365, Entra, and Intune service URLs (plus Apple endpoints for Apple-platform solutions). **Why:** Enrollment, policy sync, and authentication depend on these endpoints. **Verify:** From a device, reach `https://login.microsoftonline.com` and `https://enrollment.manage.microsoft.com`. **Implement:** Allow Microsoft's published Office 365/Intune URL & IP ranges (and Apple's published ranges where applicable) through proxy/firewall.

The Phoenixtekk deployment model (all solutions): Assess → Configure → Pilot → Validate → Expand.

3. Implementation — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Follow these steps **in order**. The *why* for each capability lives in the Solution Overview; the steps below are deliberately short and exact so you can **click to implement**. Throughout, the Phoenixtekk pattern applies: **Assess → Configure → Pilot → Validate → Expand.** Do everything against a **pilot group / pilot Smart Group** first.

Consoles used:

- **Apple Business Manager** — `https://business.apple.com`
- **Jamf Pro** — your instance, e.g. `https://yourorg.jamfcloud.com`
- **Microsoft Intune admin center** — `https://intune.microsoft.com`
- **Microsoft Entra admin center** — `https://entra.microsoft.com`

> ***Integration naming note:*** *Microsoft and Jamf renamed the macOS integration from the legacy "Conditional Access" to* ***Device Compliance / Partner device management****. The steps below use the current model; confirm the exact menu labels in your tenant's Jamf and Microsoft docs.*

Phase 1 — Connect Apple to Jamf Pro

Step 1. Create the Jamf APNs (MDM Push) certificate

1. In Jamf Pro, go to **Settings** → **Global** → **Push certificates** (or **Global Management → Push Certificates**).
1. Click **New**, choose to create an **MDM Push Certificate**, and **download the CSR**.
2. Click through to **Apple Push Certificates Portal** (`https://identity.apple.com`) and sign in with a **company Apple ID** (record which Apple ID — you must reuse it every year).
1. **Create a Certificate**, upload the CSR, then **download** the signed `.pem`.
2. Back in Jamf, **upload** the `.pem` and enter the Apple ID used.
3. Confirm the certificate shows **valid** with an expiration ~1 year out.

Step 2. Create the Automated Device Enrollment instance (download Jamf public key)

1. In Jamf Pro, go to **Settings** → **Global** → **Automated Device Enrollment**.
2. Click **New** and **download the public key** (`.pem`).

Step 3. Create the MDM server in Apple Business Manager

1. In ABM, go to **Preferences (your name, bottom-left)** → **MDM Servers**.
2. Click **Add** (or **+**). Name it clearly, e.g. **Jamf – Production**.
3. Under **MDM Server Settings**, **Upload** the Jamf public key from Step 2.
4. Click **Save**, then **Download Token** — this downloads the server token (`.p7m`).

Step 4. Upload the ABM token into Jamf

1. Back in Jamf's **Automated Device Enrollment** instance, **upload** the `.p7m` server token and enter the **Apple ID** used for ABM.

1. **Save.** The instance shows a future token expiration. Use **Refresh** to pull assigned devices.

Phase 2 — Assign devices and define the enrollment experience

Step 5. Assign Macs to the Jamf MDM server (in ABM)

1. In ABM, go to **Devices**.
2. Select the target Mac(s) by serial number (or filter by order).
3. Click **Edit MDM Server** → choose your **Jamf – Production** server → **Continue** → **Confirm**.

Step 6. Refresh and confirm devices in Jamf

1. In Jamf Pro → **Settings** → **Global** → **Automated Device Enrollment** → **(your instance)**, click **Refresh** (Apple rate-limits syncs; allow a few minutes).

1. Confirm the assigned serial numbers appear under the instance.

Step 7. Create the macOS PreStage Enrollment

1. In Jamf Pro, go to **Computers** → **PreStage Enrollments** → **New**.

2. **General:** name it (e.g. **macOS ADE – Pilot**); select the **Automated Device Enrollment instance** from Step 4.

1. Enable **Supervision** and **Make MDM Profile Mandatory** (prevents users from removing management).

1. **Account Settings:** configure the local account creation model (e.g. create a managed admin and a standard user, or defer user creation to Platform SSO per your design).

1. **Configuration Profiles / Enrollment Packages:** attach the **Single Sign-On Extensions** profile (Step 10) and the **Company Portal** app (Step 9) so they deploy at enrollment.

1. **Setup Assistant panes:** hide unnecessary panes (Restore, Apple ID, Siri, Analytics, Touch ID as policy dictates) for a clean first-run; keep **Location** and **Privacy** as required.

1. **Scope:** assign the pilot serial numbers. **Save.**

Phase 3 — Deploy Company Portal and Platform SSO (via Jamf)

Step 8. Create the pilot Smart Group

1. In Jamf Pro, go to **Computers** → **Smart Computer Groups** → **New**.

2. Name it **macOS SSO – Pilot**; add a criterion that matches your pilot devices (e.g. by PreStage, building, or serial list). **Save.**

Step 9. Add and scope the Company Portal app

1. In Jamf Pro, add **Company Portal** for macOS — via **Computers** → **Mac Apps** (App Installers/VPP) or as a signed **package** under **Computers** → **Packages** + a policy.

1. Scope it to the **macOS SSO – Pilot** Smart Group, set to install automatically (Required).

Step 10. Create the Platform SSO configuration profile

1. In Jamf Pro, go to **Computers** → **Configuration Profiles** → **New**.

2. **General:** name it **macOS Platform SSO – Pilot**; **Level = Computer Level**.

3. Add the **Single Sign-On Extensions** payload and configure:

• **Payload Type: SSO** (Redirect)

• **Extension Identifier:** `com.microsoft.CompanyPortalMac.ssoextension`

• **Team Identifier:** `UBF8T346G9`

• **Sign-On Type: Redirect**

• **URLs:** `https://login.microsoftonline.com`, `https://login.microsoft.com`, `https://sts.windows.net`, `https://login.partner.microsoftonline.cn`, `https://login.chinacloudapi.cn`, `https://login.microsoftonline.us`, `https://login-us.microsoftonline.com`

• **Platform SSO** → **Authentication Method: Secure Enclave Key** (recommended)

• Enable **Use Platform SSO** and (optional) **Token to user identifier** / new-user creation per your account model.

1. **Scope** to the **macOS SSO – Pilot** Smart Group. **Save.**

> *Prefer automation? Run the included* `JAMFADE-Set-JamfSSOProfile.ps1` *(Jamf Pro Classic API) to upload and scope this profile with the values above — then verify it in the Jamf console.*

Phase 4 — Connect Jamf to Intune and enforce SSO

Step 11. Enable the Jamf ↔ Intune Device Compliance integration

1. In **Intune** → **Tenant administration** → **Connectors and tokens** → **Partner device management** (or

Partner compliance management), enable the connection for **Jamf** (this consents the Jamf cloud-connector app in Entra).

1. In **Jamf Pro** → **Settings** → **Global** → **Device Compliance** → **macOS** → **Configure**.

2. Click **Connect**, sign in with a **Global Administrator** to grant consent, and complete the

connection. Confirm Jamf reports the connection as **active**.

1. In Intune, **Tenant administration** → **Partner device management** now shows **Jamf** as **Active**.

Step 12. Confirm device registration & compliance flow

1. In Jamf, ensure the pilot Smart Group is **scoped for compliance** (the macOS Device Compliance

settings define which computers register and report).

1. After a pilot Mac registers (via Company Portal), confirm it appears in **Intune → Devices →

macOS **as** partner-managed **with a** compliance** state.

Step 13. Create the macOS Conditional Access policy (enforce SSO)

1. In **Entra** → **Protection** → **Conditional Access** → **Create new policy**; **name it** `CA – macOS (Jamf) Compliant – Pilot`.

2. **Users:** your pilot group. **Target resources:** Office 365 (and other apps as needed).

3. **Conditions** → **Device platforms: macOS**.

4. **Grant: Require device to be marked as compliant** (optionally add **Require authentication

strength → Phishing-resistant** to require the Secure Enclave credential).

1. **Enable policy: Report-only** for the pilot. **Create.**

Phase 5 — Pilot, validate, expand

Step 14. Pilot-enroll a test Mac

1. **Erase** the pilot Mac (**System Settings → General → Transfer or Reset → Erase All Content and

Settings**) so it returns to Setup Assistant. *(For a Configurator-added device, complete this before the 30-day provisional period ends.)*

1. Power on, choose language/region, connect to network.

2. Setup Assistant shows a **Remote Management** screen naming your organization (Jamf).

3. Complete enrollment; the PreStage applies, **Company Portal** installs, and the **SSO** profile

deploys.

1. Open **Company Portal** and complete the **Register** prompt to finish Platform SSO registration

and Entra device registration (a key icon / login-window prompt confirms it).

Step 15. Validate

1. Run `JAMFADE-JamfReadiness.ps1` (Jamf side: ADE instance, PreStage, SSO profile) and

`JAMFADE-Discovery.ps1` (Intune/Entra side: Jamf partner active, compliance policy, CA policy, Company Portal).

1. Run `JAMFADE-Validation.ps1` for the pilot Mac: confirm it is **registered** in Entra,

compliant in Intune (partner-managed), and the **SSO profile** is applied.

1. On the Mac, open a Microsoft 365 web app and confirm **silent SSO** (no password prompt).
2. Confirm the Conditional Access **report-only** result in Entra **sign-in logs** shows the policy

would apply and the device evaluates as **compliant**.

Step 16. Expand

1. Once the pilot passes, widen the PreStage scope and the SSO/Company Portal/compliance Smart Group

to broader populations (or make the PreStage the default for the ADE instance).

1. Move the Conditional Access policy from **report-only** to **On** for macOS.
2. Roll out in waves, validating each wave with the scripts before widening.

5. Testing & Validation — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Validate against a **pilot device** before expanding. Each test has an explicit **pass/fail gate**. Use the included PowerShell scripts for tenant-side checks (Microsoft Graph and the Jamf Pro API) and the on-device steps for the user experience.

Test 1 — Jamf side readiness

Procedure: Run `JAMFADE-JamfReadiness.ps1` (Jamf Pro API). **Pass:** Jamf **APNs** valid (>30 days), an **Automated Device Enrollment** instance present with a token >30 days, at least one macOS **PreStage Enrollment**, and a **Single Sign-On Extensions** (Platform SSO) configuration profile present. **Fail:** Any missing or expiring within 30 days → resolve before enrolling devices.

Test 2 — Intune/Entra side readiness

Procedure: Run `JAMFADE-Discovery.ps1` (Microsoft Graph). **Pass: Jamf** shows as an **Active** device-compliance partner for macOS, a macOS **compliance policy** exists, a **Conditional Access** policy targets macOS requiring compliance, and the macOS **Company Portal** is available. **Fail:** Partner not active, or compliance/CA policy missing → fix per Implementation §Phase 4.

Test 3 — Device appears as ADE in Jamf

Procedure: In Jamf → Automated Device Enrollment → (instance), or run `JAMFADE-JamfReadiness.ps1`. **Pass:** The pilot serial is listed and **scoped to the PreStage**, ready for

enrollment. **Fail:** Serial missing → re-check ABM MDM-server assignment (R5) and **Refresh** the instance.

Test 4 — Zero-touch enrollment into Jamf

Procedure: Erase the pilot Mac and run Setup Assistant on a managed network. **Pass:** A **Remote Management** screen names your organization (Jamf); enrollment completes without manual MDM-profile installation; the device appears in **Jamf** → **Computers** within minutes. **Fail:** No Remote Management screen → device not assigned/refreshed, or network blocks `mdmenrollment.apple.com` (R12).

Test 5 — Supervision and lock

Procedure: Inspect the enrolled device in Jamf (or run `JAMFADE-JamfReadiness.ps1`). **Pass:** Device is **Supervised = Yes** and the MDM profile is **mandatory** (user cannot remove it). **Fail:** Supervised = No → the PreStage did not enable **Supervision** (Step 7); re-erase and re-enroll after correcting.

Test 6 — Company Portal + Platform SSO registration

Procedure: After desktop loads, confirm Company Portal installed and complete the **Register** prompt; then check the SSO state. **Pass:** Company Portal reports the device **registered**; macOS shows the Platform SSO login-window prompt / key indicator; `JAMFADE-Validation.ps1` reports the device **registered** in Entra and the SSO profile **applied**. **Fail:** No registration prompt → confirm Company Portal is scoped/installed (R8) and the SSO profile is scoped (Step 10), then retry.

Test 7 — Single sign-on works

Procedure: On the Mac, open a Microsoft 365 web app (e.g. `https://outlook.office.com`) in Safari and Edge/Chrome; open a native app that supports the broker. **Pass:** Sign-in is **silent** (no password prompt) using the registered Entra identity. **Fail:** Repeated password prompts → verify the SSO extension URLs and identifiers (Step 10), and that the Microsoft Enterprise SSO extension is present.

Test 8 — Secure Enclave authentication method

Procedure: Confirm the Platform SSO method in effect. **Pass:** Authentication uses the **Secure Enclave key** (hardware-bound); the local password is decoupled from Entra. **Fail:** Method shows password sync when Secure Enclave was intended → correct the SSO profile (Step 10) and **re-register**.

Test 9 — Compliance flows Jamf → Intune

Procedure: Review the pilot Mac in **Intune** → **Devices** → **macOS** (or run `JAMFADE-Validation.ps1` / `JAMFADE-DeviceReport.ps1`). **Pass:** The Mac appears as **partner-managed (Jamf)** with a **Compliant** state reported to Intune. **Fail:** Device absent or non-compliant → confirm the Device Compliance integration is **Active** (R10) and the Jamf compliance scope includes the device (Step 12).

Test 10 — Conditional Access enforces SSO

Procedure: With the CA policy in **report-only**, sign in to Microsoft 365 from the Mac and review Entra **sign-in logs**. **Pass:** The CA policy evaluates the Mac as **compliant** and (if configured) satisfies the phishing-resistant strength; in **report-only** it shows "would have applied / granted." **Fail:** Policy reports

non-compliant or not-registered → resolve Tests 6/9 first, then re-test before switching CA to **On**.

Acceptance gate

Proceed to **Expand** only when Tests 1–10 pass on at least one pilot Mac and the user-experience checks (silent SSO, clean first-run) are confirmed by a real pilot user. Switch Conditional Access from **report-only** to **On** only after Test 10 passes.

6. Troubleshooting — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Work top-down: confirm the **Apple** ↔ **Jamf connection** (APNs/ADE token), then **assignment** (ABM → Jamf), then the **device** (enrollment/supervision), then **Platform SSO**, then the **Jamf** ↔ **Intune compliance** flow and **Conditional Access**. Most failures are an expired token, an unassigned device, a missing integration, or a blocked network endpoint.

The Mac never shows a "Remote Management" screen

- **Device not assigned to the Jamf MDM server.** ABM → **Devices** → confirm **MDM Server** = your Jamf server (R5). After fixing, Jamf → Automated Device Enrollment → **Refresh**.
- **Not scoped to a PreStage.** Jamf → **PreStage Enrollments** → confirm the serial is scoped (R6).
- **Already past Setup Assistant.** ADE only triggers during Setup Assistant — **Erase All Content and Settings** and try again.
- **Network blocks Apple.** Ensure `mdmenrollment.apple.com` and `gdmf.apple.com` are reachable and **not** TLS-inspected (R12).
- **Configurator device past 30-day window** or released by the user — re-add and re-assign.

Enrollment fails partway / device not in Jamf

- **Jamf APNs certificate invalid/expired.** Jamf → **Push certificates** must be valid (R3). If it was renewed with a *different* Apple ID, devices unenroll — restore the original Apple ID.
- **ADE token expired.** Renew the ABM server token (R4); re-upload to the Jamf ADE instance.

Device enrolled but not Supervised

- The **PreStage** didn't enable **Supervision** (Step 7). Correct the PreStage, then **erase and re-enroll** — supervision is set at enrollment and cannot be toggled on an enrolled device.

Company Portal doesn't install

- Confirm the app is scoped to the pilot Smart Group and set to install automatically (R8/Step 9).

• Force a check-in: on the Mac, run **Self Service** or `sudo jamf recon` / `sudo jamf policy`; in Jamf, confirm the computer's **inventory** updates.

Platform SSO never prompts to register

• **Company Portal missing or outdated** — it performs registration (R8); update it.

• **SSO profile not scoped** to the device (Step 10). Confirm scope and that the profile installed (System Settings → Privacy & Security → Profiles).

• **Extension identifiers wrong** — must be `com.microsoft.CompanyPortalMac.ssoextension` / team `UBF8T346G9` (Step 10).

• **macOS too old** — Platform SSO requires macOS 13+ (14+ recommended) (R7).

• After fixing, sign out/in or reboot to re-trigger the registration prompt.

Registered, but apps still prompt for a password

• **Missing SSO URLs** — ensure all Microsoft login URLs are listed in the SSO extension (Step 10).

• **Browser without broker support** — Safari/Edge/Chrome with the Microsoft SSO extension get silent SSO; some third-party browsers won't.

• **Conditional Access interruption** — a policy may require interaction; review CA sign-in logs in Entra.

Secure Enclave method not taking effect

• The profile may be set to **password sync**. Set **Authentication Method = Secure Enclave Key** (Step 10), re-scope, and **re-register** (sign out/in). Existing registrations keep their original method until re-registered.

Mac doesn't appear in Intune / shows non-compliant

• **Device Compliance integration not active.** Intune → **Tenant administration → Partner device management **must show** Jamf = Active **(R10). Re-run consent in Jamf** → Device Compliance** if needed.

• **Device not in the Jamf compliance scope.** Confirm the Smart Group used for compliance includes the Mac (Step 12).

• **Not registered in Entra.** Registration happens via **Company Portal** — complete Test 6 first.

• **Inventory stale.** Run `sudo jamf recon` to push fresh inventory; compliance reflects on the next sync.

Conditional Access blocks a Mac it shouldn't

• **Compliance not yet reported.** New devices may take a sync cycle — confirm Intune shows **Compliant** before enforcing.

• **Policy too broad.** Keep CA in **report-only** for the pilot; review Entra **sign-in logs** to see exactly which control failed before switching to **On** (Step 13).

• **Authentication strength mismatch.** If you required phishing-resistant strength, the Mac must be using the **Secure Enclave** method (Test 8).

Integration renamed / steps don't match the console

• Microsoft and Jamf **superseded the legacy "Conditional Access"** integration with **Device Compliance / Partner device management**. If a menu label differs, follow the** current** Jamf and Microsoft documentation for the macOS Device Compliance integration.

Token / certificate expiry (preventive)

• The Jamf **APNs certificate** and the **ADE token** expire **annually** and **block enrollment** if lapsed. Run `JAMFADE-JamfReadiness.ps1` regularly; it flags anything expiring within 30 days. Renew APNs with the **same Apple ID** each time.

Useful checkpoints

• **Jamf:** Computers → (device) → **Inventory / Management / Configuration Profiles**; Settings → Global → **Automated Device Enrollment / Push certificates / Device Compliance**.

• **Intune/Entra:** Devices → macOS → (device) → **Compliance**; Tenant administration → **Partner device management**; Entra** → Conditional Access **+** Sign-in logs**.

• **On the Mac: System Settings** → **Privacy & Security** → **Profiles**; **Console.app** filtered for `AppSSO` / `DeviceManagement`; `sudo jamf recon` to refresh inventory.

• **Scripts:** re-run `JAMFADE-Validation.ps1` after each change to confirm the gate.

7. Best Practices — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Field-proven guidance to keep the Jamf-managed, Entra-enforced deployment reliable, secure, and low-maintenance.

Architecture & ownership

• **Keep one MDM authority.** Jamf is the **MDM**; Intune/Entra are the **identity & compliance** authority. Never try to dual-enroll a Mac into both Jamf and Intune MDM.

• **Document the split.** Record which controls live in Jamf (enrollment, profiles, patch, Self

Service) versus Entra/Intune (registration, compliance, Conditional Access) so the team knows where to look.

Identity & authentication

• **Standardize on the Secure Enclave key method.** It is phishing-resistant and decouples the local password from Entra. Reserve password sync for edge cases that genuinely need it.

• **Pair Platform SSO with a phishing-resistant Conditional Access strength** once the pilot is clean, so the Secure Enclave credential is actually required, not just available.

• **Enforce with Conditional Access in waves** — start **report-only**, confirm compliance is flowing, then turn the macOS policy **On**.

Enrollment hygiene

• **Always supervise** company Macs (Step 7) and make the **MDM profile mandatory** so management can't be removed.

• **Buy through channels linked to ABM** so devices appear automatically; use Apple Configurator only for legacy stock, and complete enrollment before the **30-day provisional period** lapses.

• **Keep one well-named MDM server** per environment in ABM (e.g. *Jamf – Production*) to avoid assigning devices to the wrong tenant.

• **Use Smart Groups** to drive scope (PreStage, SSO profile, Company Portal, compliance) so a device picks up everything automatically as it enrolls.

Token & certificate lifecycle (the #1 cause of outages)

• **Track both annual expiries** — the Jamf **APNs certificate** and the **ADE token**. A lapse blocks all new enrollments and can unenroll devices.

• **Always renew APNs with the same company Apple ID.** Document which Apple ID owns it; never use a personal Apple ID or one tied to an individual who may leave.

• **Schedule** `JAMFADE-JamfReadiness.ps1` to run regularly and alert on anything within 30 days of expiry.

Operating system & updates

• **Set a minimum-OS rule in both places** — a Jamf Smart Group/policy and a matching Intune **compliance** rule (macOS 14+ recommended) so Platform SSO works reliably and out-of-support Macs are flagged and blocked by Conditional Access.

• **Manage updates in Jamf** (Software Updates / DDM) so the fleet stays patched without user

intervention.

Rollout discipline

- **Pilot first, expand in waves.** Validate each wave with `JAMFADE-Validation.ps1` before widening.
- **Hide noisy Setup Assistant panes** for a clean, fast first-run, but keep privacy/location prompts

that your policy requires.

- **Pre-stage apps and profiles** (Company Portal + SSO) in the PreStage so a freshly enrolled Mac is

useful — and registerable — within minutes.

Operations & documentation

- **Keep a runbook** of the Apple ID, ABM org, Jamf MDM server name, APNs/ADE expiry dates, the SSO

profile identifiers, and the Device Compliance connector status — the values that, if lost, are painful to recover.

- **Report monthly** with `JAMFADE-DeviceReport.ps1`: macOS count, Platform SSO registration coverage,

Entra registration, and Intune compliance (partner-managed) — so drift is visible early.

- **Re-validate the Jamf ↔ Intune integration after major updates** to either platform; Microsoft and

Jamf occasionally change the connector and the SSO/Platform-SSO behavior between releases.

Security posture

- **Combine with disk encryption** (FileVault, escrowed to Jamf) and a **macOS security baseline** for

a complete managed posture.

- **Make compliance meaningful** — define Intune compliance to reflect real Jamf signals (encryption,

OS version, etc.) so Conditional Access enforces a genuine security bar, not just registration.

- **Limit local admin** and use Jamf to manage privileged access; supervised + mandatory enrollment

prevents users from quietly removing management.

8. Deliverables Summary — macOS Automated Device Enrollment with SSO (Jamf Pro + Microsoft Intune)

Everything included in this solution package, and what each piece is for.

Documentation (this guide)

- **Executive Summary** — the business case and outcome in one page.

- **Solution Overview** — what ADE, Platform SSO, and the Jamf ↔ Intune Device Compliance integration

are, how they work together, why Jamf is the MDM and Intune the identity/compliance authority, the authentication methods, benefits, and honest limitations.

- **Requirements Guide** — every Apple/Jamf/Intune prerequisite with how to **verify** and how to

implement if missing, plus the category-level Global Requirements.

- **Implementation Guide** — exact, ordered, click-by-click steps across five phases: connect Apple to

Jamf, assign devices & define the PreStage, deploy Company Portal + Platform SSO via Jamf, connect Jamf to Intune and create the Conditional Access policy, then pilot/validate/expand.

- **Testing & Validation** — ten tests with explicit pass/fail gates and an acceptance gate.

- **Troubleshooting** — top-down diagnosis for enrollment, Platform SSO, compliance, and Conditional

Access failures.

- **Best Practices** — architecture/ownership, identity, enrollment hygiene, the all-important

token/certificate lifecycle, OS/updates, rollout discipline, and security posture.

PowerShell scripts — `JAMFADE-Scripts.zip`

Each script has a header explaining **Purpose · How to run · Expected results**. Three use the **Microsoft Graph** PowerShell SDK (Intune/Entra side); two call the **Jamf Pro API** (MDM side).

1. `JAMFADE-Discovery.ps1` (Graph) — Intune/Entra readiness: the **Jamf device-compliance partner**

is **Active** for macOS, a macOS **compliance policy** exists, a **Conditional Access** policy targets macOS, and the macOS **Company Portal** is available. Flags gaps.

1. `JAMFADE-Validation.ps1` (Graph) — validates a specific Mac: **Entra-registered**, reported by

the Jamf partner, and **compliant** in Intune — with a clear PASS/FAIL summary.

1. `JAMFADE-DeviceReport.ps1` (Graph) — tenant-wide CSV report of macOS devices: registration,

ownership, compliance state, and partner-managed (Jamf) status.

1. `JAMFADE-JamfReadiness.ps1` (Jamf Pro API) — Jamf-side readiness: APNs status/expiry, the

Automated Device Enrollment instance/token expiry, macOS **PreStage** presence, and the **Single Sign-On Extensions** (Platform SSO) profile presence. Flags anything within 30 days of expiry.

1. `JAMFADE-Set-JamfSSOProfile.ps1` (Jamf Pro Classic API) — uploads and scopes the macOS Platform

SSO (Single Sign-On Extensions) configuration profile with the correct Microsoft Enterprise SSO identifiers, URLs, and Secure Enclave method.

Hero image

- `JAMFADE-hero.png` — the branded product image (1200×1200) used on the marketplace listing.

How it's delivered

A branded **Word** document and **PDF** (cover, table of contents, page numbers, and a scripts appendix), plus all five PowerShell scripts in a single **ZIP** — yours to keep and reuse across **unlimited devices**.

Appendix A — PowerShell Scripts

Included in the accompanying ZIP. Each script's header documents full usage.

JAMFADE-DeviceReport.ps1

Purpose: Produces a CSV of every macOS device known to Intune (including Jamf partner-managed records): device name, serial, OS version, ownership, management agent, compliance state, Entra registration, and last sync. Use it monthly to track Platform SSO registration coverage and Conditional-Access readiness across the Jamf-managed fleet.

How to run: Install-Module Microsoft.Graph -Scope CurrentUser # once .\JAMFADE-DeviceReport.ps1 # writes .\JAMFADE-macOS-report.csv .\JAMFADE-DeviceReport.ps1 -Path C:\Temp\macs.csv Reads only — makes no changes.

JAMFADE-Discovery.ps1

Purpose: Confirms the Microsoft side is ready to treat Jamf-managed Macs as registered, compliant, Conditional-Access-gated devices: - the Jamf device-compliance PARTNER is Active for macOS, - at least one macOS COMPLIANCE policy exists, - a CONDITIONAL ACCESS policy targets macOS, - the macOS Company Portal app is available. This is the Intune/Entra counterpart to JAMFADE-JamfReadiness.ps1 (which checks the Jamf MDM side). Jamf — not Intune — is the MDM, so APNs/ADE tokens live in Jamf and are checked there.

How to run: Install the SDK once: Install-Module Microsoft.Graph -Scope CurrentUser Then: .\JAMFADE-Discovery.ps1 Reads only — makes no changes.

JAMFADE-JamfReadiness.ps1

Purpose: Confirms the Jamf Pro side is ready to auto-enroll Macs and deploy Platform SSO: - an Automated Device Enrollment (ADE) instance with a token >30 days from expiry, - at least one macOS PreStage Enrollment, - a configuration profile containing the Single Sign-On Extensions (Platform SSO) payload. This is the Jamf counterpart to JAMFADE-Discovery.ps1 (which checks the Intune/Entra side). Jamf — not Intune — holds the APNs and ADE tokens, so they are validated here.

How to run: # Use a Jamf Pro account (or API client) with read access to enrollment + config profiles. $cred = Get-Credential # Jamf username / password (or API client id/secret) .\JAMFADE-JamfReadiness.ps1 -JamfUrl https://yourorg.jamfcloud.com -Credential $cred # Or pass an existing bearer token: .\JAMFADE-JamfReadiness.ps1 -JamfUrl https://yourorg.jamfcloud.com -BearerToken Reads only — makes no changes.

JAMFADE-Set-JamfSSOProfile.ps1

Purpose: Uploads a macOS Single Sign-On Extensions (Platform SSO) configuration profile to Jamf Pro with the correct Microsoft Enterprise SSO identifiers, login URLs, and the Secure Enclave authentication method — the same profile described in the Implementation Guide §Phase 3 / Step 10 — and scopes it to a target Smart Computer Group. Jamf is the MDM, so the SSO profile is delivered by Jamf (not Intune).

How to run: $cred = Get-Credential # Jamf account with config-profile write # Preview only (no change): .\JAMFADE-Set-JamfSSOProfile.ps1 -JamfUrl https://yourorg.jamfcloud.com -Credential $cred -TargetGroup "macOS SSO - Pilot" -WhatIf # Create & scope: .\JAMFADE-Set-JamfSSOProfile.ps1

-JamfUrl https://yourorg.jamfcloud.com -Credential $cred -TargetGroup "macOS SSO - Pilot" # Choose a different method: .\JAMFADE-Set-JamfSSOProfile.ps1 -JamfUrl ... -Credential $cred -TargetGroup ... -AuthMethod passwordSync

JAMFADE-Validation.ps1

Purpose: Confirms that one specific Mac is, on the Microsoft side: - REGISTERED in Microsoft Entra ID (a macOS/MacMDM device object exists), - reported by the Jamf partner and present in Intune as a managed device, - COMPLIANT (the state Jamf reports through the Device Compliance integration). Use after a pilot Mac completes Company Portal registration (Implementation Test 6/9).

How to run: Install-Module Microsoft.Graph -Scope CurrentUser # once .\JAMFADE-Validation.ps1 -SerialNumber C02XXXXXXXXX # or match by device name: .\JAMFADE-Validation.ps1 -DeviceName "Jane-MacBook" Reads only — makes no changes.
