Executive Summary — Group Policy to Intune Settings Migration (Microsoft Intune)

White-label · Intune Solutions

Decades of Group Policy keep your domain-joined PCs in line — but those settings only apply on the corporate network, they don't follow cloud-joined or remote devices, and nobody fully knows what is actually in the GPO estate anymore. This solution gives you a **structured migration** from Active Directory Group Policy to **Microsoft Intune**: inventory what you really have, translate supported settings to the **Intune settings catalog** and **imported ADMX** policies, handle the settings Intune can't take, manage **coexistence and precedence** so on-prem and cloud policy don't fight, and cut over **by rings** — without losing a setting that mattered.

This is a complete, **deploy-it-today** package for migrating Group Policy to Intune, written for an administrator with no prior migration experience.

What you get

- A plain-language **Solution Overview** of how GPO and Intune policy differ, the settings catalog and imported ADMX model, the Group Policy analytics workflow, coexistence/precedence, and the ring-based cutover.
- A **Requirements Guide** with verify / implement-if-missing for every prerequisite.
- An **Implementation Guide** of precise, click-by-click steps in the required order — export GPOs, run Group Policy analytics, map supported settings, handle unsupported ones, set coexistence, and assign in rings.
- Five **PowerShell scripts** for GPO discovery/inventory, settings-parity validation, a migration coverage and gap report, safe conflict remediation, and a migration-ring group builder.
- **Testing** and **Troubleshooting** guides for a confident, parity-checked cutover.

What this delivers

A **translated** Group Policy estate — not a guessed one. Group Policy analytics reads your exported GPOs and reports a **migration readiness percentage**; supported settings become **settings catalog** and **imported ADMX** policies named to a strict convention; unsupported settings are documented and handled deliberately; and the on-prem-to-cloud cutover runs in **rings** behind a parity gate so a mistake is caught on a pilot, never the fleet.

The deployment model

Assess → **Configure** → **Pilot** → **Validate** → **Expand.**

Outcome

Your Group Policy settings preserved in Intune — coexistence managed during the move, conflicts resolved by design, and a ringed cutover that follows devices on or off the corporate network — proven on

a pilot before you scale.

1. Solution Overview — Group Policy to Intune Settings Migration

What this migration is

Group Policy (GPO) is the on-premises Active Directory mechanism that pushes configuration to domain-joined Windows devices. It is powerful, but it only applies when a device can reach a domain controller — so cloud-joined, remote, and hybrid devices fall out of scope. **Microsoft Intune** delivers the equivalent configuration from the cloud, to any enrolled device, anywhere. This solution is a **structured translation** of your GPO estate into Intune policy: inventory the GPOs, measure how much is supported, recreate the supported settings in Intune, handle the rest deliberately, and cut over by rings.

How GPO and Intune policy differ (why this is a translation, not a copy)

- **GPO** is processed by the device against AD on the corporate network, on a refresh interval,

using ADMX templates and security/preferences. **Intune** delivers policy over the internet to enrolled devices using the **settings catalog**, **imported ADMX (administrative templates)**, **endpoint security**, and **compliance** profiles.

- Most ADMX-backed GPO settings have a direct Intune equivalent; many **Group Policy Preferences**,

logon/startup scripts, drive maps, and a few security settings **do not** translate one-for-one and must be re-implemented another way (or retired).

- Both can apply to the same device during migration. When they conflict, you must choose a winner —

see **coexistence and precedence** below.

The Group Policy analytics workflow

Intune includes **Group Policy analytics**, which reads an **exported GPO backup** and tells you, per setting, whether it **maps** to an Intune setting (supported), is **deprecated/not supported**, or **needs review**. It produces a **migration readiness percentage** for each imported GPO — the honest measure of how much of that GPO you can move. The standard workflow is:

1. **Export** each GPO from the domain (GPMC backup → XML/reports).
2. **Import** the export into Group Policy analytics and read the **readiness %** and per-setting

mapping.

1. **Migrate** the supported settings — analytics can generate **settings catalog** policies

directly from the mapped settings, which you then review, name, and assign.

1. **Handle** the unsupported settings (re-implement, replace, or retire) and document the decision.

What you create in Intune

- **Settings catalog** policies for supported, mapped settings (the modern, searchable surface).
- **Imported ADMX** policies for in-box and third-party administrative templates (e.g. Office, Edge, Chrome) so ADMX-only settings have a home.
- **Coexistence control** so on-prem GPO and Intune MDM policy don't fight during the move.
- **Migration ring groups** and ringed assignments for a safe, phased cutover.

Coexistence and precedence during migration

While a device is both domain-joined and Intune-enrolled (hybrid), **both** policy sources apply. By default, for most ADMX-backed settings, **Group Policy wins** over MDM. To let Intune take authority cleanly as you migrate, enable the **MDMWinsOverGP** setting (the `ControlPolicyConflict` / "MDM wins over GP" policy) so Intune's value wins where both set the same setting. Migrate setting areas deliberately — turn the matching GPO setting off (or scope the GPO away from migrated devices) as you bring each area into Intune — so there is exactly one authority per setting at the end.

The ring-based cutover

Devices move in **rings**: a small **Pilot** ring takes the new Intune policy first and is checked for **parity** (does Intune now enforce what the GPO used to?). Only after the parity gate passes do you **Expand** to the broad fleet, scoping the legacy GPO away from migrated devices as you go.

Benefits

- **Cloud reach** — policy follows remote and cloud-joined devices, not just LAN-connected ones.
- **Visibility** — you finally know what is in the GPO estate and how much is supported.
- **Safety** — parity-checked, ringed cutover catches loss on a pilot, not the fleet.
- **One authority** — coexistence handled so on-prem and cloud policy stop fighting.

Limitations (be honest with buyers)

- Not every GPO setting maps — **Group Policy Preferences**, logon scripts, drive maps, and some security settings need a different Intune approach (proactive remediations, platform scripts, endpoint security, or retirement).
- Group Policy analytics measures **readiness**, it does not flip the switch — you still review, name, assign, and validate each policy.
- Coexistence requires a deliberate precedence decision (MDMWinsOverGP) and per-area cutover to avoid double-authority drift.

The standard deployment model

> ***Export GPOs → run Group Policy analytics → translate supported settings → handle unsupported → set coexistence/precedence → assign in rings → validate parity → expand.*** *The repeatable way:* ***Assess → Configure → Pilot → Validate → Expand.***

2. Requirements Guide — Group Policy to Intune Settings Migration

Verify **every** requirement before configuring. Each entry: **Description · Why · Verify · Implement-if-missing.** Category-wide prerequisites are in `global-requirements-intune-solutions.md`.

2.1 Licensing

Description: Microsoft Intune (Plan 1, included in M365 E3/E5 or Business Premium). Group Policy analytics and the settings catalog are in-box Intune features. **Why:** Intune delivers Group Policy analytics, the settings catalog, imported ADMX, and policy assignment. **Verify:** M365 admin center → **Billing** → **Licenses**; `https://intune.microsoft.com` loads. **Implement:** Assign M365 E3/E5 or Business Premium (Intune included).

2.2 Access to export Group Policy

Description: Rights and tooling to export/back up GPOs from the domain — the **Group Policy Management Console (GPMC)** and/or the **GroupPolicy** PowerShell module on a domain-joined admin workstation. **Why:** Group Policy analytics needs a GPO **export/backup** as its input; you cannot measure readiness without it. **Verify:** Open GPMC; or run `Get-Module -ListAvailable GroupPolicy`. Run `GPOM-Discovery.ps1` (exports all GPOs to XML). **Implement:** Install **RSAT: Group Policy Management Tools** (`Add-WindowsCapability -Online -Name Rsat.GroupPolicy.Management.Tools~~~~0.0.1.0`); use an account with **GPO read** rights (e.g. Group Policy Creator Owners or delegated read).

2.3 Device enrollment in Intune

Description: Targeted devices enrolled in Intune (cloud-joined or hybrid Entra-joined). **Why:** Translated Intune policy applies only to enrolled devices. **Verify:** Intune → **Devices** → **All devices**; the device appears. **Implement:** Enable automatic enrollment; for hybrid devices configure Entra Hybrid Join + Intune auto-enrollment.

2.4 Group Policy analytics available

Description: Access to **Reports** → **Group Policy analytics** in the Intune admin center. **Why:** This is where you import GPO backups, read the **migration readiness %**, and generate settings catalog policies from mapped settings. **Verify:** Intune → **Reports** → **Group Policy analytics** opens and accepts an import. **Implement:** Assign an **Intune Administrator** (or **Policy and Profile Manager**) role to the operator; no extra add-on is required.

2.5 Coexistence / precedence decision (MDMWinsOverGP)

Description: A decided answer to "during migration, when GPO and Intune set the same thing, who wins?" — implemented via the **MDM wins over GP** (`ControlPolicyConflict`) setting. **Why:** Hybrid devices receive both policy sources; without a precedence decision, GPO wins by default and your migrated Intune settings appear not to apply. **Verify:** Run `GPOM-Validation.ps1` (reports the current

`MDMWinsOverGP` state) and `GPOM-Discovery.ps1` (flags settings still owned by GPO). **Implement:** Plan to deploy the coexistence policy in Implementation Step 5; scope legacy GPOs away from migrated devices per area.

2.6 Migration ring groups

Description: Microsoft Entra security groups for the phased cutover — at minimum a pilot ring and a broad ring. **Why:** The cutover is ringed so loss is caught on a pilot before the fleet. **Verify:** Entra → **Groups**; the migration ring groups exist. Run `GPOM-Set-MigrationRingTargeting.ps1` to build them. **Implement:** Create the groups in Implementation Step 1 (or with the ring-targeting script).

2.7 Rollback plan

Description: A documented way to back out — the original GPO exports retained, legacy GPOs left **enabled but unscoped** (not deleted) until parity is proven, and a known-good restore path. **Why:** Migration must be reversible until the parity gate passes for the broad ring. **Verify:** Confirm GPO backups from `GPOM-Discovery.ps1` are retained and legacy GPOs are still present (linked-but-scoped-away, not deleted). **Implement:** Keep the export folder safe; do not delete or unlink source GPOs until the broad ring passes Testing.

Naming convention (use verbatim throughout)

All objects follow `<Purpose> – <Scope> – <Stage>`. The objects this solution creates:

Object	Name
Settings catalog policy (supported, mapped settings)	`GPO Migration – Settings Catalog – Pilot`
Settings catalog policy (broad cutover copy)	`GPO Migration – Settings Catalog – Broad`
Imported ADMX policy (administrative templates)	`GPO Migration – Imported ADMX – Pilot`
Coexistence / precedence policy (MDMWinsOverGP)	`GPO Migration – MDM Wins Over GP – All Migrated`
Pilot ring group	`GPO Migration – Devices – Pilot Ring`
Broad ring group	`GPO Migration – Devices – Broad Ring`

Checklist

- Intune licensing assigned
- Access + tooling to export GPOs — `GPOM-Discovery.ps1`
- Devices enrolled in Intune
- Group Policy analytics available (Reports → Group Policy analytics)
- Coexistence/precedence decision made (MDMWinsOverGP) — `GPOM-Validation.ps1`
- Migration ring groups created — `GPOM-Set-MigrationRingTargeting.ps1`

- Rollback plan: GPO exports retained, source GPOs not deleted

Global Requirements — Intune Solutions (category-level)

These requirements apply to **every** solution in the **Intune Solutions** category. They are published once at the category level so individual listings stay small. Confirm these before deploying *any* Intune solution. Each entry: **Description · Why · Verify · Implement-if-missing.**

G1. Microsoft Entra ID tenant

Description: An active Microsoft Entra ID (Azure AD) tenant. **Why:** It is the identity backbone for every cloud and Intune-managed resource. **Verify:** Sign in to `https://entra.microsoft.com` as an administrator. **Implement:** Create a Microsoft 365/Azure subscription, which provisions a tenant.

G2. Microsoft Intune subscription

Description: An Intune-bearing license plan. **Why:** Intune delivers all configuration, compliance, and security policies. **Verify:** `https://intune.microsoft.com` loads; **Tenant administration** → **Tenant status** shows active. **Implement:** Assign Microsoft 365 E3/E5, Business Premium, or standalone Intune Plan 1.

G3. Administrative roles

Description: Appropriate Entra/Intune admin roles for the operator. **Why:** Creating policies and enrollment settings requires elevated rights. **Verify:** Entra → **Roles and administrators**; confirm **Intune Administrator**. **Implement:** Assign **Intune Administrator**; reserve Global Administrator for tenant-wide changes.

G4. Device enrollment in Intune

Description: Targeted Windows devices are enrolled and manageable. **Why:** Policies only reach enrolled devices. **Verify:** Intune → **Devices** → **All devices**; the device appears and is **compliant**. **Implement:** Enable **Automatic Enrollment** and join devices to Entra ID.

G5. Pilot security group

Description: A Microsoft Entra security group for pilot/targeted users or devices. **Why:** Every solution is piloted before fleet rollout. **Verify:** Entra → **Groups**; the pilot group exists. **Implement:** Entra → **Groups** → **New group** → **Security** → add members.

G6. Supported Windows baseline

Description: Windows 10 21H2+ or Windows 11 with current updates. **Why:** Modern Intune features assume a patched, supported OS. **Verify:** `winver`, or Intune → device → **Hardware**. **Implement:** Deploy **Update rings** or upgrade to Windows 11.

G7. Network access to Microsoft cloud endpoints

Description: Outbound HTTPS to Microsoft 365, Entra, and Intune service URLs. **Why:** Enrollment, policy sync, and authentication depend on these endpoints. **Verify:** From a device, reach `https://login.microsoftonline.com` and `https://enrollment.manage.microsoft.com`. **Implement:** Allow Microsoft's published Office 365/Intune URL & IP ranges through proxy/firewall.

The standard deployment model (all solutions): Assess → Configure → Pilot → Validate → Expand.

3. Implementation Guide — Group Policy to Intune Settings Migration

Follow these steps **in order**. GPO export is done in the **Group Policy Management Console (GPMC)** on a domain-joined admin workstation; everything else is in the **Microsoft Intune admin center** (`https://intune.microsoft.com`). Reuse the object names from the Requirements naming convention **exactly**.

> ***Model:*** *Export and measure first, translate the supported settings, handle the unsupported ones deliberately, set who-wins precedence, then cut over by rings behind a parity gate. The repeatable way:* ***Assess → Configure → Pilot → Validate → Expand.***

Step 1 — Create the migration ring groups

1. Entra → **Groups** → **New group** → **Security** → name `GPO Migration – Devices – Pilot Ring` (a

few representative hybrid devices). **Create**.

1. Create `GPO Migration – Devices – Broad Ring` (the rest of the in-scope fleet). **Create**.
2. Or run `GPOM-Set-MigrationRingTargeting.ps1` to build both groups and seed pilot membership.

Step 2 — Export and inventory the GPOs (Assess)

1. Open **GPMC** on a domain-joined admin workstation.
2. Right-click the **domain** → **Back Up All** (or right-click a single GPO → **Back Up**), choose a

folder, and complete the wizard — this writes the GPO **backup/export** Group Policy analytics needs.

1. Alternatively, run `GPOM-Discovery.ps1`, which uses the **GroupPolicy** module

(`Get-GPO` / `Get-GPOReport`) to export every GPO to **XML** and produce an inventory you can review and retain as your rollback source.

Step 3 — Run Group Policy analytics (read the readiness %)

1. Intune → **Reports** → **Group Policy analytics** → **Import**.
2. Upload the GPO backup/export from Step 2. Repeat per GPO if you exported individually.
3. Read the **migration readiness percentage** for each imported GPO, and open it to see the

per-setting mapping: **Supported / mapped**, **Not supported / deprecated**, or **Needs review**.

1. Note which GPOs are high-readiness (migrate first) and which carry many unsupported settings (plan handling in Step 6).

Step 4 — Translate supported settings to the settings catalog

1. In **Group Policy analytics**, select the imported GPO(s) → **Migrate** (this generates a **settings catalog** policy from the **supported, mapped** settings).
1. Review the generated policy, then **Name** it `GPO Migration – Settings Catalog – Pilot`.
2. Verify each migrated setting matches the GPO's value; remove anything you do not want to migrate yet.
1. **Assignments** → **Add groups** → `GPO Migration – Devices – Pilot Ring`. **Create**.

(You can also build a settings catalog policy by hand: **Devices** → **Manage devices** → **Configuration** → **Create** → **New policy** → **Windows 10 and later** → **Settings catalog**.)

Step 5 — Import ADMX for administrative-template settings

1. For ADMX-backed settings not in the in-box catalog (e.g. Office, Edge, Chrome): Intune → **Devices** → **Manage devices** → **Configuration** → **Import ADMX**.
1. **Import** the vendor's `.admx` and `.adml` files; wait for status **Available**.
2. **Create** → **New policy** → **Windows 10 and later** → **Imported Administrative templates**, name it `GPO Migration – Imported ADMX – Pilot`, configure the settings to match the source GPO.
1. **Assignments** → **Add groups** → `GPO Migration – Devices – Pilot Ring`. **Create**.

Step 6 — Handle the unsupported settings (deliberately)

For each setting Group Policy analytics flagged **Not supported / Needs review**, decide and document one of:

1. **Re-implement** via a different Intune surface — endpoint security profile, **proactive remediation **(detect/remediate script), or a** platform script** (Devices → Scripts) for things like logon scripts or drive maps.
1. **Replace** with the modern equivalent (e.g. Group Policy Preferences drive maps → a deployment or remediation; mapped-printer GPP → Universal Print / printer policy).
1. **Retire** — the setting is obsolete and is intentionally not migrated (record the decision).

Capture every decision; `GPOM-Report.ps1` produces the coverage + gap report that lists exactly these items.

Step 7 — Set coexistence and precedence (MDMWinsOverGP)

1. **Devices → Manage devices → Configuration → Create → New policy → Windows 10 and later →

Settings catalog**.

1. Search for **MDM Wins Over GP** (the `ControlPolicyConflict` / "MDM wins over GP" setting) and

set it so **MDM wins**.

1. Name the policy `GPO Migration – MDM Wins Over GP – All Migrated`.

2. **Assignments** → **Add groups** → `GPO Migration – Devices – Pilot Ring` (extend to the broad ring

at Step 9). **Create**.

1. As each setting area is migrated, **scope the legacy GPO away** from migrated devices (security

filter / unlink for that OU) so there is one authority per setting.

Step 8 — Validate parity on the pilot (Pilot/Validate)

1. On a pilot device, sync policy (**Settings** → **Accounts** → **Access work or school** → **Info** → **Sync**).

2. Run `GPOM-Validation.ps1` → compares the source GPO settings against the applied Intune

policy and confirms `MDMWinsOverGP` is in effect.

1. Run `GPOM-Report.ps1` → confirms migration coverage and lists any remaining gaps.

2. Complete the **Testing Guide**. Do not expand until the parity gate passes.

Step 9 — Expand to the broad ring (Expand)

1. Copy the validated catalog/ADMX policies to broad scope: create

`GPO Migration – Settings Catalog – Broad` from the pilot policy (or extend its assignment), and add `GPO Migration – Devices – Broad Ring` to the coexistence policy assignment.

1. Move devices into `GPO Migration – Devices – Broad Ring` in waves; re-validate each wave with

`GPOM-Validation.ps1` / `GPOM-Report.ps1`.

1. Only after the broad ring passes parity, **scope the legacy GPOs away** from the migrated fleet

(leave them present-but-unlinked for rollback until you are confident).

Order of operations

`Ring groups → Export + inventory GPOs → Group Policy analytics (readiness %) → Settings catalog → Imported ADMX → Handle unsupported → MDMWinsOverGP coexistence → Validate parity (pilot) → Expand`

5. Testing Guide — Group Policy to Intune Settings Migration

Run after the pilot policies apply (Implementation Step 8) and again for each broad-ring wave. The goal of testing is **parity**: Intune now enforces what the GPO used to, on the right devices, with Intune as the winning authority.

Test 1 — Settings catalog policy applied

Do: Intune → **Devices** → **Manage devices** → **Configuration** → `GPO Migration – Settings Catalog – Pilot` → **Device status**. **Expected:** Pilot devices show **Succeeded**.

Test 2 — Imported ADMX policy applied

Do: Open `GPO Migration – Imported ADMX – Pilot` → **Device status**; confirm the imported ADMX shows **Available** under **Import ADMX**. **Expected:** Pilot devices show **Succeeded**; the ADMX import status is **Available**.

Test 3 — Settings parity (GPO vs Intune)

Do: On a pilot device run `GPOM-Validation.ps1` (compares source GPO settings to the applied Intune values). **Expected:** Each migrated setting reports **match**; no migrated setting is **missing** or **different**.

Test 4 — MDM wins over GP in effect

Do: Run `GPOM-Validation.ps1` (reports `MDMWinsOverGP`), or check `HKLM:\SOFTWARE\Microsoft\PolicyManager\current\device\ControlPolicyConflict`. **Expected:** `MDMWinsOverGP` is enabled — where both GPO and Intune set a value, the Intune value wins.

Test 5 — Migration coverage + gaps

Do: Run `GPOM-Report.ps1`. **Expected:** A coverage figure close to the Group Policy analytics readiness %, and a gap list that matches the unsupported settings you handled in Step 6 (nothing unexpected).

Test 6 — No conflicting double-authority

Do: Run `GPOM-Discovery.ps1` on a migrated device (flags settings still owned by a live GPO). **Expected:** For migrated areas, the legacy GPO is scoped away (no competing GPO value), or `MDMWinsOverGP` cleanly resolves it.

Test 7 — Cloud reach (off-network)

Do: Take a pilot device off the corporate network and sync; re-run `GPOM-Validation.ps1`. **Expected:** The Intune settings still apply off-network (the original GPO would not have) — confirming the cloud-reach benefit.

Pass/fail gate

Gate	Requirement
Pilot pass	Tests 1–5 pass; parity confirmed and `MDMWinsOverGP` in effect on the pilot ring
Broad pass	Tests 1, 3, 5, 6 pass for the broad ring before legacy GPOs are scoped away from the fleet

6. Troubleshooting Guide — Group Policy to Intune Settings Migration

Use `GPOM-Discovery.ps1` for GPO inventory and conflicting-authority detection, `GPOM-Validation.ps1` for settings parity and precedence state, `GPOM-Report.ps1` for coverage/gaps, and `GPOM-Remediation.ps1` (`-WhatIf` first) for safe conflict resolution.

A. Migrated settings don't apply (GPO still winning)

Symptom	Cause	Remediation
Intune policy shows Succeeded but the device behaves per the old GPO	`MDMWinsOverGP` not set — GPO wins by default	Deploy `GPO Migration – MDM Wins Over GP – All Migrated` (Step 7); re-run `GPOM-Validation.ps1`
A migrated setting is still controlled by AD	Legacy GPO still scoped to the device	Scope/unlink the legacy GPO from migrated devices; `GPOM-Discovery.ps1` flags it
Mixed results across devices	Device not synced / not in the ring group	Sync the device; confirm membership in `GPO Migration – Devices – Pilot Ring`

B. Group Policy analytics import / readiness issues

Symptom	Cause	Remediation
Import fails or shows nothing	Wrong export type (not a GPO backup)	Re-export with **GPMC** → **Back Up** or `GPOM-Discovery.ps1` (`Get-GPOReport`), then re-import
Readiness % lower than expected	GPO has many preferences/scripts/security settings	Expected — handle the unsupported settings in Step 6; `GPOM-Report.ps1` lists them
Setting shows "Needs review"	Analytics can't auto-map it	Review the source value and re-implement in the settings catalog or another surface

C. Unsupported settings (no direct Intune equivalent)

• **Group Policy Preferences** (drive maps, registry items, printers) → re-implement via a **platform script** (Devices → Scripts), a **proactive remediation**, Universal Print, or retire.

• **Logon/startup scripts** → replace with a platform script or proactive remediation.

• **Some security settings** → use an **endpoint security** profile or the security baseline instead of the settings catalog. Record every decision in the gap report.

D. Settings catalog / imported ADMX problems

Symptom	Cause	Remediation
ADMX setting can't be found in the catalog	Vendor ADMX not imported	**Import ADMX** (Step 5); wait for **Available**, then add the imported template policy
Policy error / conflict on device	Two Intune policies set the same setting differently	Consolidate; remove the duplicate; `GPOM-Validation.ps1` highlights the mismatch
Imported ADMX stuck "Uploading"	Mismatched/old `.admx`/`.adml` pair	Re-import a matching ADMX+ADML pair from the current vendor package

E. Coexistence drift (double authority)

• A setting owned by **both** GPO and Intune long-term causes flapping. Fix by enforcing one authority: keep `MDMWinsOverGP` on **and** scope the legacy GPO away for that area. Run `GPOM-Remediation.ps1 -WhatIf` to preview the precedence fix before applying.

F. Diagnostics quick reference

```
Get-GPO -All | Select-Object DisplayName, Id, GpoStatus          # GPO inventory (GroupPolicy module)
Get-GPOReport -Name 'Your GPO' -ReportType Xml -Path .\gpo.xml   # export a GPO for analytics
Get-ItemProperty 'HKLM:\SOFTWARE\Microsoft\PolicyManager\current\device\ControlPolicyConflict' -EA Silentl
gpresult /h gpresult.html                                        # what GPO is still applying on the devic
```

MDM diagnostics: **Settings** → **Accounts** → **Access work or school** → **Info** → **Create report**, or `mdmdiagnosticstool.exe -area DeviceEnrollment -cab C:\Temp\mdm.cab`.

G. When to escalate

If the Intune policy shows Succeeded, `MDMWinsOverGP` is confirmed, the legacy GPO is scoped away, the device is synced and in the correct ring group, and a migrated setting still won't take effect, collect `GPOM-Validation.ps1` output plus `gpresult /h` and the MDM diagnostics CAB and open a Microsoft support case.

7. Best Practices — Group Policy to Intune Settings Migration

• **Measure before you migrate.** Run Group Policy analytics first and let the **readiness %** drive

the order — migrate high-readiness GPOs early; plan the heavy-unsupported ones carefully.

• **Translate, never guess.** Recreate settings from the analytics mapping and the source GPO value, not from memory; confirm each migrated value with `GPOM-Validation.ps1`.

• **Decide precedence up front.** Enable **MDMWinsOverGP** before you cut over so migrated Intune settings actually win on hybrid devices — otherwise GPO wins and the work looks broken.

• **One authority per setting.** As each area moves, scope the legacy GPO away from migrated devices; never leave the same setting owned by both GPO and Intune long-term.

• **Migrate by ring, gate on parity.** A small **Pilot Ring** proves parity before the **Broad Ring** — the single most important safety practice in a migration.

• **Handle the unsupported settings deliberately.** Re-implement (proactive remediation / platform script / endpoint security), replace with the modern equivalent, or retire — and record the decision in the gap report.

• **Keep your exports and source GPOs.** Retain the GPO XML exports and leave source GPOs present-but-unscoped (not deleted) until the broad ring passes — that is your rollback.

• **Name everything to the convention.** Use `<Purpose> – <Scope> – <Stage>` for every policy and group so the estate stays auditable and the next admin understands it instantly.

• **Re-run the gap report each wave.** `GPOM-Report.ps1` should trend toward full coverage; chase anything that lingers in the gap list.

• **Document the cutover.** Record readiness %, migrated areas, unsupported-setting decisions, and the precedence model for audits and repeatability.

8. Deliverables Summary — Group Policy to Intune Settings Migration

Documentation

Document	Purpose
Executive Summary	Business case and what's in the box
1. Solution Overview	How GPO and Intune policy differ, Group Policy analytics, settings catalog + imported ADMX, coexistence/precedence, ringed cutover, benefits, limitations
2. Requirements Guide	Every prerequisite with Verify / Implement-if-missing, plus the naming convention
Global Requirements (Intune Solutions)	Category-wide prerequisites, published once

Document	Purpose
3. Implementation Guide	Exact, ordered steps: export GPOs, analytics, settings catalog, imported ADMX, handle unsupported, coexistence, ringed cutover
5. Testing Guide	Parity validation procedures with pass/fail gates
6. Troubleshooting Guide	Field issues and remediation
7. Best Practices	Field-proven recommendations

PowerShell scripts

Script	What it does
`GPOM-Discovery.ps1`	Exports/inventories every GPO via the GroupPolicy module (`Get-GPO` / `Get-GPOReport` to XML); flags settings still owned by a live GPO. Read-only.
`GPOM-Validation.ps1`	Settings parity — compares source GPO settings against the applied Intune policy and reports `MDMWinsOverGP`. Read-only.
`GPOM-Report.ps1`	Migration coverage + gap report (supported vs unsupported, what was migrated, what remains). Read-only.
`GPOM-Remediation.ps1`	Safe conflict remediation (`-WhatIf` by default) — resolves conflicting policy / sets MDM-wins precedence.
`GPOM-Set-MigrationRingTargeting.ps1`	Builds the migration ring groups (pilot/broad) via Microsoft Graph and seeds membership.

What the buyer receives

- This implementation guide as a branded **Word** document and **PDF**.
- All five **PowerShell scripts** in a single ZIP.
- A repeatable process: **Assess** → **Configure** → **Pilot** → **Validate** → **Expand.**

Outcome

A Group Policy estate translated into Intune — supported settings preserved, unsupported settings handled by design, coexistence managed, and a parity-checked ringed cutover that follows devices on or off the corporate network.

Appendix A — PowerShell Scripts

Included in the accompanying ZIP. Each script's header documents full usage.

GPOM-Discovery.ps1

Purpose: Uses the GroupPolicy module to enumerate all GPOs (Get-GPO) and export each one to an XML report (Get-GPOReport) into an output folder. The XML exports are the input for Intune's Group Policy analytics and are your retained rollback source. Read-only against the domain. HOW TO RUN On a domain-joined admin workstation with RSAT Group Policy Management Tools installed: powershell -ExecutionPolicy Bypass -File .\GPOM-Discovery.ps1 -OutputPath .\GPO-Export EXPECTED RESULTS One <GPOName>.xml per GPO in the output folder, plus a console inventory table (DisplayName, Id, GpoStatus, Created/Modified) and a CSV summary you can review and keep. .NOTES Intune Solutions. Read-only. Requires the GroupPolicy module (Add-WindowsCapability -Online -Name Rsat.GroupPolicy.Management.Tools~~~~0.0.1.0). > [CmdletBinding()] param([string] $OutputPath = ".\GPO-Export")

How to run: On a domain-joined admin workstation with RSAT Group Policy Management Tools installed: powershell -ExecutionPolicy Bypass -File .\GPOM-Discovery.ps1 -OutputPath .\GPO-Export EXPECTED RESULTS One <GPOName>.xml per GPO in the output folder, plus a console inventory table (DisplayName, Id, GpoStatus, Created/Modified) and a CSV summary you can review and keep. .NOTES Intune Solutions. Read-only. Requires the GroupPolicy module (Add-WindowsCapability -Online -Name Rsat.GroupPolicy.Management.Tools~~~~0.0.1.0). > [CmdletBinding()] param([string] $OutputPath = ".\GPO-Export")

GPOM-Remediation.ps1

Purpose: Resolves the most common migration conflict: Group Policy still winning over migrated Intune settings. It sets the local MDMWinsOverGP (ControlPolicyConflict) value so MDM/Intune wins, then requests an MDM sync so policy re-evaluates. Runs in -WhatIf mode by DEFAULT and changes nothing until you pass -Apply. The durable fix is the Intune coexistence policy 'GPO Migration - MDM Wins Over GP - All Migrated'; this script unblocks a device for testing. HOW TO RUN Preview (default, no changes): powershell -ExecutionPolicy Bypass -File .\GPOM-Remediation.ps1 Apply on a pilot device (elevated): powershell -ExecutionPolicy Bypass -File .\GPOM-Remediation.ps1 -Apply EXPECTED RESULTS In preview: prints what WOULD change (MDMWinsOverGP -> 1) and exits. With -Apply: sets MDMWinsOverGP=1, requests an MDM sync, and advises re-running GPOM-Validation.ps1. .NOTES Intune Solutions. -WhatIf by default; -Apply makes changes. > [CmdletBinding(SupportsShouldProcess = $true, ConfirmImpact = 'High')] param([switch] $Apply)

How to run: Preview (default, no changes): powershell -ExecutionPolicy Bypass -File .\GPOM-Remediation.ps1 Apply on a pilot device (elevated): powershell -ExecutionPolicy Bypass -File .\GPOM-Remediation.ps1 -Apply EXPECTED RESULTS In preview: prints what WOULD change (MDMWinsOverGP -> 1) and exits. With -Apply: sets MDMWinsOverGP=1, requests an MDM sync, and advises re-running GPOM-Validation.ps1. .NOTES Intune Solutions. -WhatIf by default; -Apply makes changes. > [CmdletBinding(SupportsShouldProcess = $true, ConfirmImpact = 'High')] param([switch] $Apply)

GPOM-Report.ps1

Purpose: Reads the GPO XML exports produced by GPOM-Discovery.ps1 and (optionally) the settings catalog policies already created in Intune (via Microsoft Graph), then reports per-GPO a coverage estimate (settings that have a migrated home) and a GAP list (settings with no Intune equivalent yet: Group Policy Preferences, scripts, drive maps, unmapped security settings). Read-only. HOW TO RUN powershell -ExecutionPolicy Bypass -File .\GPOM-Report.ps1 -ExportPath .\GPO-Export Add -UseGraph to also list the Intune settings catalog policies named 'GPO Migration - *' (requires the Microsoft.Graph module and DeviceManagementConfiguration.Read.All). EXPECTED RESULTS A per-GPO table (total settings, ADMX-backed/migratable, preferences/scripts = gaps) with a coverage %, an overall gap list exported to CSV, and — with -UseGraph — the matching Intune policies and their assignments. .NOTES Intune Solutions. Read-only. > [CmdletBinding()] param([string] $ExportPath = ".\GPO-Export", [switch] $UseGraph)

How to run: powershell -ExecutionPolicy Bypass -File .\GPOM-Report.ps1 -ExportPath .\GPO-Export Add -UseGraph to also list the Intune settings catalog policies named 'GPO Migration - *' (requires the Microsoft.Graph module and DeviceManagementConfiguration.Read.All). EXPECTED RESULTS A per-GPO table (total settings, ADMX-backed/migratable, preferences/scripts = gaps) with a coverage %, an overall gap list exported to CSV, and — with -UseGraph — the matching Intune policies and their assignments. .NOTES Intune Solutions. Read-only. > [CmdletBinding()] param([string] $ExportPath = ".\GPO-Export", [switch] $UseGraph)

GPOM-Set-MigrationRingTargeting.ps1

Purpose: Creates (idempotently) the two Entra security groups used for the ringed cutover, named to the solution convention, and optionally seeds the pilot ring with device members: 'GPO Migration - Devices - Pilot Ring' 'GPO Migration - Devices - Broad Ring' Existing groups with the same name are reused, not duplicated. HOW TO RUN powershell -ExecutionPolicy Bypass -File .\GPOM-Set-MigrationRingTargeting.ps1 Seed pilot members: ... -PilotDeviceIds 'objId1','objId2' Requires the Microsoft.Graph module and Group.ReadWrite.All (admin consent). EXPECTED RESULTS Both groups exist (created or found) with their object IDs printed; any supplied pilot device object IDs are added to the pilot ring. Use these group names verbatim in the Intune assignments from the Implementation Guide. .NOTES Intune Solutions. Creates/updates Entra groups only. > [CmdletBinding(SupportsShouldProcess = $true)] param([string[]] $PilotDeviceIds = @())

How to run: powershell -ExecutionPolicy Bypass -File .\GPOM-Set-MigrationRingTargeting.ps1 Seed pilot members: ... -PilotDeviceIds 'objId1','objId2' Requires the Microsoft.Graph module and Group.ReadWrite.All (admin consent). EXPECTED RESULTS Both groups exist (created or found) with their object IDs printed; any supplied pilot device object IDs are added to the pilot ring. Use these group names verbatim in the Intune assignments from the Implementation Guide. .NOTES Intune Solutions. Creates/updates Entra groups only. > [CmdletBinding(SupportsShouldProcess = $true)] param([string[]] $PilotDeviceIds = @())

GPOM-Validation.ps1

Purpose: Confirms that the migrated settings are actually applied by Intune on the local device and that MDM has authority. Reads the MDMWinsOverGP (ControlPolicyConflict) state and the on-device PolicyManager values that Intune sets, and (optionally) compares them against a GPO XML export from GPOM-Discovery.ps1 to report match / missing / different per setting. Read-only. HOW TO RUN On a migrated pilot device (elevated): powershell -ExecutionPolicy Bypass -File .\GPOM-Validation.ps1 -GpoReportPath .\GPO-Export\YourGPO.xml (Omit -GpoReportPath to report only the applied MDM state

and precedence.) EXPECTED RESULTS MDMWinsOverGP state (enabled/disabled), a list of applied PolicyManager values, and — when a GPO XML is supplied — a parity table marking each compared setting match / missing / different. .NOTES Intune Solutions. Read-only. > [CmdletBinding()] param([string] $GpoReportPath)

How to run: On a migrated pilot device (elevated): powershell -ExecutionPolicy Bypass -File .\GPOM-Validation.ps1 -GpoReportPath .\GPO-Export\YourGPO.xml (Omit -GpoReportPath to report only the applied MDM state and precedence.) EXPECTED RESULTS MDMWinsOverGP state (enabled/disabled), a list of applied PolicyManager values, and — when a GPO XML is supplied — a parity table marking each compared setting match / missing / different. .NOTES Intune Solutions. Read-only. > [CmdletBinding()] param([string] $GpoReportPath)
